

UC625 Compact Alarm Annunciator

It is widely acknowledged that traditional, dedicated annunciators are the safest and most reliable way of informing the operator that a process has gone beyond set limits. With this in mind, RTK Instruments Ltd has expanded its existing range of Safe and Hazardous Area Alarm Annunciators with the UC625 Compact Annunciator.

This unit is a smaller version of the field-proven Series 625 Annunciator and is targeted specifically at the latest Power Generation, Transmission and Distribution applications where safety, reliability, space and cost are key considerations. The compact design is packed with a host of new features to allow the user to adapt the unit to suit individual needs.

The displays are 'maintenance free' super-bright LEDs and, to allow the user to customise alarm windows on site, all units are supplied with a free template to make custom film legends which simply slide into the front display.

RTK
INSTRUMENTS

To provide further cost and space saving, the RTK designers have fitted a dual-redundant PSU inside the compact housing allowing the unit to be driven from an auxiliary mains supply and, if this fails, a DC battery supply. Full monitoring of these two supplies is provided with dedicated alarm windows and watchdog relays.

The UC625 Alarm Annunciator is based on the company's unique ASIC design, which is a distributed intelligence system. This gives total flexibility for the user to program as required, the best reliability and at a cost lower than many basic, fixed systems. Additional features include selectable alarm sequences, adjustable response time, individual channel repeat relays, dual programmable audibles and common alarm relays.

The use of 'maintenance free' super-bright red LEDs, distributed intelligence and 100% built-in redundant power supplies ensures maximum reliability in this safety related product.
